

It's our mission to implement electrical transport for employers without a sweat, for business- as well as commuting trips. We offer through a one stop shop a sustainable 'A to Z' solution.

At the 'Smart Home' you can see what this can look like. A charging pole with a solid bicycle clip, an eBike with 8 gears, insured, with a maintenance and break down service contract. The costs of a charge is less than 5 eurocents and gives you 50 km supported bicycle comfort.

The advantages for an eBike rider are obvious. Always wind in the back and reaching your destination free of sweat. Faster on the spot, without congestion and parking stress, always in time. When you move for a half hour or more, you already meet the minimum daily fitness norm. Fitter means less illness and faster recovery when sick. Employees and employers both gain.

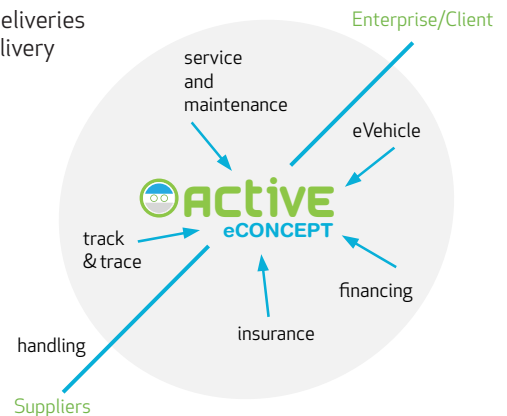

Active eConcept aims specifically at commuter trips of employees living between 5 and 20 km from work and do not yet use a bicycle. Via an eCommuteplan, we deliver a total package of measures.

For the employee: The supply of an eBike, cycling accessories, break down service, maintenance, insurance and financing.

For the employer on request: consultation of the employees, the supply of a registration- and reward system, navigation system, sustainable clothing, showering and charging facilities.

But we don't forget business travel. Calling on clients for meetings, making deliveries and delivery of services etc. The eClientplan contains a package of measures: delivery of an electrical 'fleet' to the employer, including registration system, break down service, maintenance, insurance, financing, sustainable clothing, showering and charging facilities.

Our clients are companies that want to reduce their costs, for instance in combination with sustainable business operation, reduction of their ecological 'footprint', promotion of their employees' health and improvement of their social corporate entrepreneurship image.

How do we work: After a free conversation we provide the employer an offer containing:

- A mobility scan.
- An advice on implementation on the basis of the results of the scan and a meeting with the employer and if necessary with representatives of the employees.

Only after the 'green' light by the principal implementation can start. A tailor made implementation plan entails contact hours with employees and alignment with departments that deal with mobility issues (HRM, facility management, etc.), plus the co-ordination of delivery of products and services, corresponding contracts and agreements. Active eConcept takes it off your hands.

Our partners are reputable suppliers; in the case of the 'Smart Home' NSA Urban Products from Hengelo. They produce the Bikeeep bicycle clamps with charging unit. Secure, solid and great for eBikes. The eBike is an lbee3 of Bikkel Bikes from Nederweert. The strong small electric engine in the front wheel is powered by a Li-ion battery enough for at least a 50 km radius.
